Computer Forensics Lab: Compromised Windows Analysis

Summary

This lab focuses on investigating a **compromised Windows workstation** using TryHackMe's **Compromised Windows Analysis** room. Students will examine key Windows forensic artifacts to identify evidence of malicious activity and understand how a Windows system was compromised. The lab provides hands-on experience analyzing artifacts generated by the operating system and user activity, identifying indicators of compromise, and reconstructing events related to a security incident. Through the investigation, students will develop practical skills in Windows forensic analysis, evidence interpretation, and incident investigation while working through a realistic compromised-system case.

Lab Link: https://tryhackme.com/room/compromisedwindowsanalysis

Objectives

- Investigating the persistence of the attack
- Analyzing attacker's footprints for root cause analysis
- Gathering evidence of any malicious file execution
- Windows event logs analysis for intrusion & defense evasion
- Building a timeline analysis of the attack

Conclusion (Student Task – What You Learned)

Write a short conclusion (1 paragraph) describing what you learned from completing this lab.

Your conclusion should answer: (**Maximum 1 page**)

1- What new skills or concepts did you gain
2- How can this lab support computer forensic investigations and help reconstruct a potential attack path
3- How can this knowledge be used to improve Windows OS privacy and security knowledge

Submission Requirements

- Submit as a formatted document (Word or PDF)
- **Add a screenshot of the Completion of the Entire Lab Or screenshots of the Completion of All Tasks. You must include the Date/Time from your device on the Screenshot.**
- Use clear, professional writing when answering the above questions.
- Include your name, date, and lab title at the top of the document
